

PORTFOLIO RELEASE REPORT - R372 V6

BUYER RELEASE SCOPE

This release presents 4 packages selected for the current buyer engagement from the portfolio owner's technology-transfer portfolio. The identity registry, the release manifest and the master ZIP describe exactly this release; package selection is the portfolio owner's disposition, and every selected package is presented with its full evidence record including its recorded uncertainties and decisive next experiment.

RELEASE IDENTITY INTEGRITY

One canonical registry (PORTFOLIO_IDENTITY_REGISTRY.json) binds each portfolio number (01-15) to its immutable historical package ID (P-01..P-29), folder name, dossier hash, package-ZIP hash and manifest hash. Historical IDs are never renumbered. Every buyer document carries the identity line 'Portfolio NN - Package P-XX - Version V' in its footer, derived from the same mapping. Verification protocol: registry hashes recomputed from disk; folder, manifest and ZIP identities cross-checked for all 15 packages (results: INTERNAL_QA acceptance reports).

ARCHIVE CONSISTENCY

RELEASE_CONTENT_MANIFEST.json is generated by walking the actual release filesystem; README.md is generated FROM that manifest; the master ZIP is built from the same manifest. A file that is not on disk cannot appear in the README, and every file the README names is present in the ZIP. DOWNLOAD/ is the single authoritative release tree (the former FULL_DOSSIERS/ and BUYER_OUTREACH/ duplicate trees were removed in this release; history preserved in git and in RELEASE/history_r370/).

ENGINEERING TRACEABILITY SEMANTICS (explicit - no ambiguous 'passed' flags)

Every DI/DO/FM/V chain slot is classified EXPLICIT / PARTIAL / UNKNOWN / NOT_APPLICABLE with a record-cited justification. A package passes with incomplete traceability only when every non-explicit slot is explicitly justified. The table shows, per package: critical design inputs (quantitative acceptance criteria), chains with at least one explicit link, chains with only partial links, chains with no recorded link, explicitly not-applicable chains, and unbound design outputs / failure modes. This release does NOT represent the traceability graph as healthy: at ENGINEERING_DEFINITION maturity most DI-to-DO bindings are downstream engineering development, and that is stated per slot in each package's ENGINEERING_TRACEABILITY.json.

Pkg	critical_DIs	explicit	partial	unknown	n/a	orphan_DOs	orphan_FMs	state
P-07	4	0	0	10	0	3	5	UNKNOWN
P-16	4	0	0	9	0	4	6	UNKNOWN
P-24	2	0	0	9	0	4	7	UNKNOWN
P-27-R1	3	0	0	11	0	4	7	UNKNOWN

GOVERNING-EQUATION VALIDATION (THREE LEVELS)

All 16 canonical governing equations carry recorded variables, per-variable unit status (R374-3), domain, operating regime (boundary conditions), assumptions, applicability and limitations (known failure regimes). Validation is reported at THREE SEPARATE levels (CEO R374-2): STRUCTURAL (the canonical math string parses as a well-formed relation), APPLICABILITY (the applicability envelope is fully recorded) and DIMENSIONAL (unit algebra performed under RECORDED units and consistent). The word 'validated' never implies an unproven level. Dimensional outcomes: {'NOT_EVALUABLE_UNITS_UNRECORDED': 14, 'NOT_EVALUABLE_SYNTAX': 1, 'NOT_EVALUABLE_NO_EQUALITY': 1}. Zero equations are dimensionally inconsistent. The dominant dimensional state is honestly NOT_EVALUABLE: the engineering record does not assign units to most equation symbols (14 of 16), and units are taken ONLY from recorded critical parameters — standard-symbol guesses are not used (Constitution Art. VI). Every unrecorded-unit symbol carries UNIT_STATUS = UNKNOWN with a resolution path in the shipped EQUATION_REGISTRY.json per package. Populating the unit fields of the critical parameters is buyer-side engineering work recorded in the unknown roadmaps.

EVIDENCE DISCIPLINE

Market size: NOT_ESTABLISHED for every package (no market-research source is integrated; no figures are invented). Competitor claims: none authored by the transferor - company names appear only inside cited, hashed external-precedent snippets. Engineering thresholds: no new thresholds were invented - the unsupported \$5K/\$25K/\$100K template ladder was retired and cost is stated as NOT_ESTABLISHED. Prototypes: none exist and none are depicted; both technical visuals per package are labeled engineering-definition schematics auto-derived from the canonical record, with every label's provenance classified (canonical / historical / spec / physiology / structural) and zero untraced labels.

V2 MUTATION APPLICATION

Eight packages carry recorded V2 mutations driven by externally generated, reconciled evidence (10 mutations total). In this release the V2 text is RENDERED in the buyer documents (the prior release shipped the addenda without re-rendering the PDFs). The full V1->V2 trail ships in each affected package, and the R372 acceptance gate verifies per mutation that the buyer receives V2 in the PDF, the JSON and the ZIP (V1 text absent from all buyer documents).

AI LOOP STATE

{"NONE": 14, "SYNTHETIC_LOOP_VERIFIED": 1, "REAL_LOOP_VERIFIED": 0} - Not yet demonstrated. Zero REAL events across the portfolio. The release architecture is ready to receive them (LOOP_STATE.json event queues + engine REALITY_EVENT interface).

RELEASE STATUS

This release is submitted as PORTFOLIO_RELEASE_CANDIDATE for CEO audit. It is not self-certified as complete: the acceptance gate runs mechanically and independently (r371.acceptance + r372.acceptance_r372), and independent audit is required (Constitution Art. XXVI).
