

Evidence Summary - Technology #162

Wind the copper tube on a mandrel with a controlled axial preload so the coil is slightly compressed against the cylindrical shroud inner wall, then install a removable slotted pitch-retention cage (stainless steel or PEEK) that engages each coil turn at three or more circumferential points without soldering; apply a thin hydrophobic or low-surface-energy coating (e.g., PTFE or silane-based) to the coil exterior and shroud interior to reduce scale adhesion, and add a short straight inlet diffuser to stabilize flow before the helical section.
